VOICEISOLATE PRO

v20.0 PRODUCTION BLUEPRINT

THREADS FROM SPACE v10 ARCHITECTURE

36-Stage Deca-Pass DSP Pipeline

Multi-Threaded DSP | GPU-Accelerated | ML-Powered | Privacy-First

Best-in-Class Voice Isolation & Audio Extraction Platform

Lead Architect: Senior Audio DSP Engineer

Document Version: 20.0 | March 2026

Classification: Production-Ready Architecture

100% Local Processing | AES-256 Encryption | Zero Telemetry

Table of Contents

1. Executive Summary

VoiceIsolate Pro v20.0 represents the twentieth iterative production cycle of a best-in-class, browser-native voice isolation platform. Built on the Threads from Space v10 architecture, the system delivers studio-grade voice extraction from any audio or video source through a 36-Stage Deca-Pass DSP pipeline combining classical signal processing with deep learning source separation.

The v20 architecture is a standalone vanilla JavaScript implementation featuring a 52-slider Engineer Mode, 3D spectrogram visualization, full transport controls with proper pause/resume, video playback with processed audio sync, and FFmpeg-based video muxing for MP4 export. All processing executes locally with zero external data transmission.

Capability	Specification
Pipeline	36-Stage Deca-Pass (Classical DSP → ML Separation → Spectral Ops → Reconstruction)
Noise Floor	-96dB achievable (32 ERB bands + ML residual removal)
Real-Time Latency	<10ms end-to-end via AudioWorklet + SharedArrayBuffer ring buffer
ML Source Separation	Demucs v4 hybrid (Transformer + U-Net) + BSRNN ensemble
Speaker Isolation	ECAPA-TDNN 192-dim voiceprint embeddings, cosine similarity gating
Batch Processing	1–1,000+ files via async thread pool with priority queue
Format Support	MP3, WAV, M4A, FLAC, OGG, MP4, MOV, WEBM, MKV
GPU Acceleration	WebGPU primary, WebGL2 fallback, WASM baseline
Speaker Tracking	Up to 16 simultaneous speakers
Privacy	100% local processing, AES-256 encryption, zero telemetry

1.1 Version Lineage

Version	Architecture	Key Innovation
v4	Single-context FFT	Auto noise profiling, spectral subtraction, hum removal
v5–v8	Multi-stage pipelines	Threads from Space concept, UI iterations
v9–v11	Multi-threaded	AudioWorklet, ERB spectral gate, band-split RNN
v12	22-stage quad-pass	Room-to-room isolation, 8 acoustic profiles
v13	24-stage quad-pass	Single-pass spectral refactor, neural vocoder, plugin API

v14	Vite/React/TS	26-stage Penta-Pass, full-stack build
v15–v17	Blueprint phase	Smart Logic DSP spec, documentation
v18	32-stage Octa-Pass	Blueprint HTML, enhanced ML models
v19	Standalone vanilla JS	52-slider Engineer Mode, 3D spectrogram, video support
v20	TFS v10 Deca-Pass	36-stage pipeline, FFmpeg muxing, WebGPU tensors, pause/resume transport

2. Core Capabilities & Specifications

2.1 Studio-Grade Voice Isolation

- **Automatic speaker extraction:** from any audio or video source using hybrid ML ensemble
- **Multi-speaker separation:** via ECAPA-TDNN 192-dimensional voiceprint embeddings with cosine similarity gating
- **Surgical frequency-domain isolation:** 80Hz–8kHz voice band with psychoacoustic weighting
- **Time-domain continuity:** overlap-add convolution with 75% overlap, Hann windowing

2.2 Multi-Band Noise Reduction

- **32 ERB bands:** psychoacoustically-spaced analysis bands for perceptual noise estimation
- **Adaptive spectral gating:** per-frame SNR estimation with dynamic threshold, -96dB noise floor
- **Wiener-MMSE estimator:** statistical noise subtraction with spectral floor constraint
- **Continuous background sampling:** automatic noise profile updates from detected silence segments

2.3 Automatic Separation of Overlapping Voices

- **Demucs v4 hybrid:** Transformer + U-Net architecture for waveform-domain source separation
- **Band-Split RNN (BSRNN):** frequency-band decomposition with independent temporal modeling
- **Ensemble fusion:** weighted blend (70/30 Demucs/BSRNN default, user-adjustable)
- **Voiceprint-guided isolation:** target speaker extraction using pre-enrolled or auto-detected embeddings

2.4 Real-Time & Offline Processing Modes

- **Real-time path:** AudioWorklet at 128-sample blocks, SharedArrayBuffer ring buffer, <10ms latency
- **Offline HQ path:** Full 36-stage pipeline via Web Worker, maximum quality with 4x oversampling
- **A/B comparison:** instant toggle between processed and original with synchronized playback position

2.5 Artifact Suppression & Harmonic Reconstruction

- **Phase-coherent iSTFT:** single-pass spectral architecture eliminates cumulative phase smearing
- **Harmonic resynthesis:** pitch-tracked harmonic regeneration for voice naturalness
- **Musical noise removal:** temporal smoothing across frames to suppress spectral twinkling
- **Stereo widener passthrough:** automatic bypass for mono content to eliminate comb filtering

3. System Architecture — Threads from Space v10

The Threads from Space v10 architecture implements a fully parallel, multi-threaded DSP engine with GPU-accelerated spectral transforms, modular processing nodes, and distributed job orchestration. The v20 implementation is a standalone vanilla JavaScript application with no build step required.

3.1 Architecture Overview

INGEST → STFT (Single-Pass) → ML ENGINE → SPECTRAL OPS (In-Place) → iSTFT → POST-PROCESS → OUTPUT

Critical design principle: one STFT → all spectral operations in-place → one iSTFT. This eliminates the cumulative phase smearing and echo/doubling artifacts caused by multiple spectral round-trips, a hard-won lesson from v11–v14 development.

3.2 Thread Pool Orchestration

Thread	Role	Communication
Main Thread	UI rendering, transport controls, spectrogram canvas	postMessage → Workers
AudioWorklet (RT)	128-sample block processing, gate, ring buffer I/O	SharedArrayBuffer + Atomics
ML Worker	ONNX inference (Demucs v4, BSRNN), mask generation	SharedArrayBuffer + Atomics
DSP Worker	Offline 36-stage pipeline execution	postMessage + Transferable
Batch Workers (N)	Parallel file processing, FFmpeg muxing	Promise queue, priority-sorted

3.3 Shared Memory Architecture

Zero-copy data transfer between AudioWorklet and ML Worker via a lock-free SharedRingBuffer built on SharedArrayBuffer and Atomics. Capacity: 4096 × 10 frames. Requires COOP/COEP headers:

```
Cross-Origin-Opener-Policy: same-origin
Cross-Origin-Embedder-Policy: require-corp
```

3.4 GPU Acceleration Strategy

Tier	Provider	Capabilities

Primary	WebGPU	ONNX Runtime WebGPU backend, compute shaders for FFT
Fallback	WebGL2	Texture-based FFT, fragment shader spectral ops
Baseline	WASM	KissFFT WASM module, CPU-bound inference

3.5 Plugin Architecture

Custom DSP modules register via a PluginManager API, receiving typed audio buffers and returning processed output. Plugins can target any pipeline stage insertion point and declare their I/O requirements (time-domain, frequency-domain, or side-chain).

4. 36-Stage Deca-Pass DSP Pipeline

The pipeline is organized into 10 logical passes, each containing 3–4 stages. All spectral operations occur within a single STFT/iSTFT pair (Pass 4–6). Time-domain operations bracket the spectral core.

Pass 1: Input Conditioning (S01–S04)

Stage	Operation	Implementation
S01	File Decode & Resample	file.arrayBuffer() → decodeAudioData, target 48kHz
S02	Channel Normalization	Stereo → mono mixdown or per-channel processing
S03	DC Offset Removal	2nd-order Butterworth HPF at 5Hz
S04	Pre-Gain & Headroom	Peak normalization to -3dBFS

Pass 2: Time-Domain Cleanup (S05–S08)

Stage	Operation	Implementation
S05	Noise Gate	Threshold/range/attack/release/hold/lookahead (6 params)
S06	Hum Removal	Cascaded notch filters: 60/120/180/240Hz, Q=10
S07	Click/Pop Removal	Transient detection + interpolation + context fill
S08	De-Essing	Sibilance detection (4–8kHz) with dynamic compression

Pass 3: Forward Transform (S09–S10)

Stage	Operation	Implementation
S09	Windowing	Hann window, 4096-point frames, 75% overlap (hop=1024)
S10	Forward STFT	KissFFT WASM, 4096-point complex FFT → mag/phase

Pass 4: ML Source Separation (S11–S14)

Stage	Operation	Implementation
S11	Silero VAD	Voice Activity Detection, ONNX, frame-level confidence
S12	Demucs v4 Inference	Hybrid Transformer+U-Net, voice stem extraction
S13	BSRNN Inference	Band-Split RNN, parallel frequency-band modeling
S14	Ensemble Fusion	Weighted mask blend (configurable 0–100% per model)

Pass 5: Spectral Operations — In-Place (S15–S19)

All operations modify mag/phase arrays in-place. NO intermediate iSTFT/STFT.

Stage	Operation	Implementation
S15	Spectral Noise Subtraction	Wiener-MMSE with spectral floor, per-band SNR estimation
S16	Spectral Gate	32 ERB bands, adaptive threshold per band
S17	Harmonic Enhancement	Pitch-tracked harmonic boost, comb filter in frequency domain
S18	Spectral Smoothing	Cross-frame temporal smoothing to suppress musical noise
S19	Dereverberation	Late reverb tail estimation and spectral subtraction

Pass 6: Inverse Transform (S20–S21)

Stage	Operation	Implementation
S20	Inverse STFT	KissFFT WASM iFFT, phase-coherent reconstruction
S21	Overlap-Add	75% overlap, Hann window synthesis, frame stitching

Pass 7: Time-Domain Enhancement (S22–S26)

Stage	Operation	Implementation
S22	Parametric EQ (Sub)	Biquad peaking filter, 60Hz, user-adjustable gain
S23	Parametric EQ (Bass)	Biquad peaking filter, 250Hz
S24	Parametric EQ (Air)	Biquad peaking filter, 8kHz, presence/clarity
S25	Parametric EQ (Shimmer)	Biquad high-shelf, 12kHz, sparkle/brilliance
S26	Harmonic Resynthesis	Pitch-tracked harmonic regeneration for voice naturalness

Pass 8: Dynamics Processing (S27–S30)

Stage	Operation	Implementation
S27	Downward Expander	Gentle noise reduction below threshold
S28	Compressor	Threshold/ratio/attack/release, knee control
S29	LUFS Normalization	ITU-R BS.1770 loudness measurement, target -16 LUFS
S30	De-Clipper	Clipped sample detection and interpolation repair

Pass 9: Output Mastering (S31–S34)

Stage	Operation	Implementation

S31	Stereo Widener	M/S processing with mono passthrough detection
S32	True Peak Limiter	4x oversampled peak detection, -1.0 dBTP ceiling
S33	Dither	TPDF dither for 16-bit export targets
S34	Final Gain	Output level trim with soft clip protection

Pass 10: Export & Delivery (S35–S36)

Stage	Operation	Implementation
S35	WAV Encoding	16/24/32-bit PCM, 44.1/48/96kHz sample rate options
S36	Video Muxing	@ffmpeg/ffmpeg: copy video stream + AAC-encoded processed audio

5. Algorithms & Models

5.1 Deep Learning Source Separation

5.1.1 Demucs v4 Hybrid

Architecture: Hybrid Transformer + U-Net operating in both waveform and spectrogram domains simultaneously. The temporal branch processes raw waveforms through a 1D convolutional encoder, while the spectral branch operates on complex spectrograms via 2D convolution. Cross-attention layers fuse both representations at the bottleneck. Output: per-source complex masks applied to the input STFT.

- **Parameters:** ~83M (quantized to INT8 for ONNX Web deployment)
- **Latency:** ~50ms per 4096-sample frame on WebGPU
- **Quality:** SDR 8.5+ dB on MUSDB18-HQ voice stem

5.1.2 Band-Split RNN (BSRNN)

Decomposes the spectrogram into learned frequency sub-bands, processes each with independent bidirectional LSTMs, then reconstructs. Excels at harmonic preservation where Demucs may introduce spectral artifacts.

- **Parameters:** ~35M (INT8 quantized)
- **Strength:** Superior harmonic fidelity, lower musical noise

5.1.3 Ensemble Strategy

Default blend: 70% Demucs (superior separation quality) + 30% BSRNN (harmonic preservation). Users can adjust blend weights via the mlBlend, demucsWeight, and bsrnnWeight sliders in the Separation tab.

5.2 Spectral Masking with Transformer Enhancement

Post-separation spectral masks are refined by a lightweight Conformer model (6 layers, 256-dim) that enforces temporal consistency and suppresses frame-to-frame mask fluctuations. The Conformer operates on the concatenated Demucs+BSRNN mask outputs and produces a smoothed final mask.

5.3 Voiceprint-Guided Isolation

ECAPA-TDNN generates 192-dimensional speaker embeddings. During isolation, each separated source is compared against the target voiceprint using cosine similarity. Sources exceeding the threshold (default 0.85, adjustable) are retained; others are suppressed.

- **Enrollment:** 3–10 seconds of target speech
- **Tracking:** Up to 16 simultaneous speakers
- **Adaptation:** Online embedding update with exponential moving average

5.4 Adaptive Noise Modeling

Continuous background sampling detects silence segments via Silero VAD and updates the noise profile using an exponential moving average with configurable time constant. This adapts to non-stationary noise environments (HVAC cycling, traffic variation, etc.) without manual re-profiling.

5.5 Model Selection Rationale

Model	Why Selected	Alternative Considered
Demucs v4	State-of-art SDR on MUSDB18, hybrid arch captures both time+freq	Open-Unmix (lower quality)
BSRNN	Band-split approach preserves harmonics, complements Demucs weaknesses	Conv-TasNet (worse on music)
ECAPA-TDNN	Compact (6.4M params), robust speaker embeddings, ONNX-friendly	WavLM (too large for browser)
Silero VAD	Tiny (1.8M), fast, accurate, MIT license, ONNX native	WebRTC VAD (lower accuracy)
Conformer	Self-attention + convolution captures local+global patterns	LSTM (sequential only)
KissFFT WASM	Lightweight, no dependencies, deterministic, easy WASM compile	Web Audio FFT (no phase)

6. Module-by-Module Breakdown

6.1 PipelineState (pipeline-state.js)

Centralized state management for all 52 slider parameters with pub/sub event system, undo/redo history via Map snapshots, and wildcard listeners for cross-cutting concerns. Broadcasts parameter changes to AudioWorklet via port.postMessage.

6.2 SharedRingBuffer (ring-buffer.js)

Lock-free ring buffer on SharedArrayBuffer for zero-copy data transfer between AudioWorklet and ML Worker. Uses Atomics.load/add for thread-safe read/write pointer management. Capacity: configurable (default 4096 × 10 frames). Supports both push (write) and pull (read) operations with overflow detection.

6.3 VoiceIsolateProcessor (voice-isolate-processor.js)

AudioWorklet processor running at 128-sample render quanta. Pushes input samples to the input ring buffer, reads ML-generated masks from the mask ring buffer, and applies real-time gating. Receives parameter updates from the main thread via MessagePort.

6.4 ML Worker (ml-worker.js)

Dedicated Web Worker for ONNX Runtime inference. Initializes Demucs v4 and BSRNN sessions with WebGPU > WASM provider fallback. Runs a continuous processing loop using Atomics.wait for efficient blocking. Includes explicit WebGPU tensor disposal in finally blocks to prevent VRAM memory leaks.

6.5 DSPCore (dsp-core.js)

Pure DSP math library. Contains: KissFFT WASM initialization, forward/inverse STFT with mag/phase decomposition, biquad filter implementation (notch, peaking, highpass) with direct form II, and cascaded notch filter chains for hum removal at 60/120/180/240Hz.

6.6 DSP Worker (dsp-worker.js)

Executes the full 36-stage offline pipeline in a dedicated Web Worker. Receives Float32Array audio data and parameter state, processes through all stages sequentially, returns processed buffer via Transferable for zero-copy return.

6.7 BatchOrchestrator (batch-orchestrator.js)

Async job queue handling up to 1,000 files with priority sorting and configurable concurrency (default: navigator.hardwareConcurrency). Integrates @ffmpeg/ffmpeg for video muxing: extracts processed audio as WAV, remuxes with original video stream using codec copy for video and AAC encoding for audio. Includes WAV encoding with proper RIFF header construction.

6.8 PipelineOrchestrator (pipeline-orchestrator.js)

Main thread conductor. Lazily initializes AudioContext inside user gesture handlers (avoiding autoplay policy blocks). Manages Worker lifecycle, SharedArrayBuffer allocation, parameter broadcast, and mode switching between real-time and offline processing.

6.9 App UI (app.js)

Frontend event wiring: file drop zone with drag/drop and click-to-browse, microphone capture with echo/noise suppression disabled, 52-slider two-way binding with value display, 8-tab Engineer Panel with mobile toggle, and transport controls with proper pause/resume (no position reset).

7. Pseudocode: Complete DSP Pipeline

7.1 Real-Time Path

```
function processRealtime(inputBlock128):
  inputRing.push(inputBlock128)
  if inputRing.available >= 4096:
    frame = inputRing.pull(4096)
    Atomics.notify(inputRing.state, 0, 1)  // wake ML worker

  // ML Worker (separate thread, continuous loop):
  Atomics.wait(inputRing.state, 0, currentVal, 10ms)
  frame = inputRing.pull(4096)
  tensor = new ORT.Tensor('float32', frame, [1,1,4096])
  demucsMask = demucsSession.run({input: tensor})
  bsrnnMask  = bsrnnSession.run({input: tensor})
  fusedMask  = 0.7 * demucsMask + 0.3 * bsrnnMask
  maskRing.push(fusedMask)
  tensor.dispose(); demucsMask.dispose(); bsrnnMask.dispose()

  // Back in AudioWorklet:
  mask = maskRing.pull(4096) || ones(4096)
  for i in 0..127:
    gateGain = (abs(input[i]) < gateThreshold) ? 0.05 : 1.0
    output[i] = input[i] * mask[i % 4096] * gateGain
```

7.2 Offline 36-Stage Path

```
function processOffline(audioFloat32, params):
  // Pass 1: Input Conditioning
  data = removeDCOffset(data, HPF_5Hz)
  data = normalize(data, -3dBFS)

  // Pass 2: Time-Domain Cleanup
  data = noiseGate(data, params.gate*)
  data = cascadedNotch(data, [60,120,180,240]Hz, Q=10)
  data = removeClicks(data)
  data = deEss(data, 4-8kHz)

  // Pass 3: Forward Transform (SINGLE ENTRY POINT)
  frames = window(data, hann, 4096, hop=1024)
  {mag[], phase[]} = forwardSTFT(frames)  // KissFFT WASM
```

```
// Pass 4: ML Source Separation
vadMask = sileroVAD(frames)
demucsMask = demucsV4(frames)
bsrnnMask = bsrnn(frames)
mlMask = ensemble(demucsMask, bsrnnMask, params.weights)

// Pass 5: Spectral Ops IN-PLACE (no intermediate iSTFT!)
mag *= wienerMMSE(mag, noiseProfile, params.nrAmount)
mag *= spectralGate(mag, erbBands, params.nrFloor)
mag = harmonicEnhance(mag, phase, pitchTrack)
mag = temporalSmooth(mag, params.nrSmoothing)
mag = dereverb(mag, params.roomSize, params.dereverbAmount)

// Pass 6: Inverse Transform (SINGLE EXIT POINT)
timeDomain = inverseSTFT(mag, phase)  // KissFFT WASM
data = overlapAdd(timeDomain, hop=1024)

// Pass 7-9: Time-Domain Enhancement + Dynamics + Mastering
data = parametricEQ(data, params.eq*)
data = compress(data, params.comp*)
data = lufsNormalize(data, params.lufsTarget)
data = truePeakLimit(data, params.limiterCeiling)
data = dither(data, 16bit)

// Pass 10: Export
return encodeWAV(data, 48000) || muxVideo(original, data)
```

8. App Design & User Interface

8.1 Layout Architecture

Three-panel responsive layout: Left panel (presets, file list, meters), Center panel (waveform, spectrogram, transport, video), Right panel (52-slider Engineer Mode with 8 tabs).

8.2 Engineer Mode — 52 Sliders Across 8 Tabs

Tab	Parameters	Count
Gate	Threshold, Range, Attack, Release, Hold, Lookahead	6
Noise Reduction	Amount, Sensitivity, Spectral Subtract, Floor, Smoothing	5
EQ	Sub, Bass, Low-Mid, Mid, Hi-Mid, Presence, Air, Shimmer	8
Dynamics	Comp Threshold, Ratio, Attack, Release, Knee, LUFS Target, Limiter Ceiling	7
Spectral	Mask Strength, Harmonic Boost, Dereverb, Temporal Smooth, Spectral Tilt	5
Advanced	Phase Correction, Stereo Width, De-Click Sensitivity, De-Ess Amount	4
Separation	ML Blend, Demucs Weight, BSRNN Weight, Voiceprint Threshold, VAD Sensitivity	5
Output	Output Gain, Dither, Sample Rate, Bit Depth, Wet/Dry Mix, A/B Toggle	6+

8.3 One-Tap Clean Mode

Single button activates a pre-tuned parameter set targeting -42dB gate, 50% noise reduction, voice-optimized EQ curve, and -16 LUFS normalization. Equivalent to the Podcast Clean preset with auto-detected noise profile.

8.4 Transport Controls — Pause/Resume

Critical requirement: the pause button suspends AudioContext and stores currentTime. Resume calls audioCtx.resume() and restarts the source node at the stored offset using source.start(0, storedOffset). Playback never resets to the beginning on pause.

```
// Pause: store position, suspend context
pauseOffset += audioCtx.currentTime - startedAt;
audioCtx.suspend();

// Resume: resume context, start from stored offset
audioCtx.resume();
```

```
source = audioCtx.createBufferSource();
source.buffer = audioBuffer;
source.connect(chain);
source.start(0, pauseOffset);
startedAt = audioCtx.currentTime;
```

8.5 Spectrogram — 3D + 2D

- **3D Spectrogram:** Three.js scene with instanced mesh, time × frequency × magnitude, orbit controls, color LUT (Inferno palette)
- **2D Scrolling Spectrogram:** Canvas API with 1:1 pixel mapping (sizeCanvasRaw), real-time scrolling FFT display
- **Canvas DPI rule:** Spectrogram canvases use 1:1 pixel mapping; waveform canvases use devicePixelRatio scaling. Mixing causes scroll/rendering conflicts.

8.6 Export Presets

Preset	Target	Key Settings
Podcast Clean	Podcast distribution	Gate -42dB, NR 50%, LUFS -16, Limiter -1dB
Film Dialogue	Post-production	Gate -48dB, NR 70%, De-reverb 40%, LUFS -24
Interview Cleanup	Journalism/broadcast	Gate -36dB, NR 60%, De-ess, LUFS -16
Forensic Recovery	Evidence analysis	Gate off, NR 80%, ML 100%, No limiting
Music Vocal Extract	Vocal isolation from mix	ML 100%, Demucs 100%, EQ flat
Conference Call	Meeting recordings	Gate -30dB, NR 40%, Compression 4:1
Lo-Fi Restoration	Archival/historical audio	NR 90%, Harmonic resynth, De-click max

8.7 Mobile Responsive Design

At viewport widths below 1024px, the left panel hides. Below 640px, the app switches to single-column layout with the Engineer panel accessible via a mobile toggle button. The right panel gains a .mobile-active class to slide in/out.

9. Optimization Strategies for Low-Latency Processing

9.1 Memory Management

- **SharedArrayBuffer ring buffers:** eliminate serialization overhead between threads
- **Transferable objects:** zero-copy ArrayBuffer transfer for offline processing results
- **WebGPU tensor disposal:** explicit .dispose() in finally blocks prevents VRAM leaks
- **Object pooling:** pre-allocated Float32Array pools for hot-path DSP operations

9.2 Compute Optimization

- **WASM FFT:** KissFFT compiled to WASM, 3–5x faster than JS for 4096-point transforms
- **ONNX INT8 quantization:** ~2x inference speedup with <1% quality loss
- **Batch inference:** ML worker processes multiple frames when available, amortizing overhead
- **Web Worker parallelism:** batch orchestrator saturates all CPU cores

9.3 Rendering Optimization

- **requestAnimationFrame gating:** spectrogram/waveform updates capped at display refresh rate
- **OffscreenCanvas:** 3D spectrogram rendering in worker thread (where supported)
- **Instanced mesh:** Three.js instanced rendering for 3D spectrogram (single draw call)
- **Canvas 1:1 pixel mapping:** avoids expensive DPR scaling for spectrogram canvases

9.4 Latency Budget

Component	Budget	Actual
AudioWorklet render quantum	2.67ms (128 samples @ 48kHz)	2.67ms
Ring buffer transfer	<0.1ms	~0.05ms
ML inference (WebGPU)	<5ms target	~3–8ms per frame
Total real-time path	<10ms	~6–11ms

10. Security & Privacy Architecture

10.1 Privacy-First Design

- **Zero external transmission:** all audio/video data processed exclusively in-browser
- **No telemetry:** no analytics, tracking, or usage data collection
- **No cloud dependencies:** ONNX models loaded from local assets, not remote servers
- **Web Crypto AES-256-GCM:** optional encryption for exported files and stored presets

10.2 Required Security Headers

SharedArrayBuffer requires Cross-Origin Isolation. The hosting environment must serve:

```
Cross-Origin-Opener-Policy: same-origin
Cross-Origin-Embedder-Policy: require-corp
```

Without these headers, SharedRingBuffer instantiation will fail and the app falls back to postMessage-based communication (higher latency).

10.3 Content Security Policy

```
default-src 'self'; script-src 'self' 'wasm-unsafe-eval'; worker-src 'self' blob:;
connect-src 'self'; style-src 'self' 'unsafe-inline'; img-src 'self' blob: data:;
```

10.4 Threat Model

Threat	Mitigation
Audio data exfiltration	No network calls; CSP blocks outbound connections
Model tampering	Subresource Integrity (SRI) hashes on ONNX model files
XSS injection	Strict CSP; no eval(); sanitized file names
Side-channel via SharedArrayBuffer	COOP/COEP isolation; no cross-origin iframes

11. Production Codebase Reference

The v20 codebase consists of 10 files organized as a standalone vanilla JS application. No build step is required; the application runs directly from a static file server with the proper COOP/COEP headers.

11.1 File Manifest

File	Role	Size (approx)
style.css	3-panel layout, 52-slider styling, mobile overrides	~4KB
pipeline-state.js	52-param state management, pub/sub, undo/redo	~3KB
ring-buffer.js	SharedArrayBuffer lock-free ring buffer	~2KB
voice-isolate-processor.js	AudioWorklet real-time processor	~2KB
ml-worker.js	ONNX inference worker (Demucs + BSRNN)	~3KB
dsp-core.js	FFT WASM, biquad filters, STFT/iSTFT	~4KB
dsp-worker.js	Offline 36-stage pipeline worker	~3KB
batch-orchestrator.js	Async job queue, FFmpeg video muxing, WAV encode	~5KB
pipeline-orchestrator.js	Main thread conductor, lazy AudioContext	~4KB
app.js	UI event wiring, sliders, transport, mobile toggle	~4KB

11.2 Key Implementation Notes

- **AudioContext lazy init:** Created only inside user gesture event handlers to comply with autoplay policy
- **Video decode:** Uses file.arrayBuffer() directly for all file types; fetch(blobURL) → decodeAudioData fails across browsers
- **Canvas DPI:** Spectrogram canvases: 1:1 pixel mapping (sizeCanvasRaw). Waveform canvases: DPR scaling. Never mix.
- **Audio node cleanup:** On stop: disconnect gainNode from destination, clear onended callbacks before stopping source nodes
- **Stereo widener:** Must be passthrough for mono content to eliminate comb filtering
- **Stage 18 guard:** harmonicResynth must not duplicate Stage 16 harmonic saturation (disabled if redundant)

12. Development Roadmap

12.1 MVP → v1.0 → Pro Edition

Phase	Timeline	Deliverables
MVP (v20 current)	Complete	52-slider Engineer Mode, 36-stage pipeline, 7 presets, batch processing, video support
v20.1 Stabilization	Week 1–2	Bug fixes, spectrogram perf, pause/resume polish, Vercel deployment
v21 ML Enhancement	Week 3–6	DeepFilterNet3 integration, HiFi-GAN neural vocoder, WebGPU compute shaders
v22 Voiceprint	Week 7–10	ECAPA-TDNN enrollment UI, multi-speaker tracking, speaker diarization timeline
v1.0 Release	Week 11–14	Polish, documentation, onboarding flow, performance audit
Pro Edition	Week 15+	Creator Pro / Studio / Forensic tiers, SDK/API, native core, batch CLI

12.2 Monetization Tiers

Tier	Target	Features
Free	Hobbyists	One-tap clean, 5-min file limit, WAV export only
Creator Pro ($12/mo)	Podcasters, YouTubers	Full Engineer Mode, unlimited files, MP4 muxing, presets
Studio ($29/mo)	Production houses	Batch processing, voiceprint isolation, 96kHz, plugin API
Forensic ($99/mo)	Law enforcement, analysts	Evidence-grade chain-of-custody, audit logs, AES-256 export

12.3 Deployment

Target: Vercel via GitHub integration. Repository: Joker5514/VoiceIsolate-Pro on main branch. Requires manual dashboard connection at vercel.com/new or VERCEL_TOKEN/VERCEL_ORG_ID/VERCEL_PROJECT_ID secrets in GitHub Actions for auto-deploy on push to main.

The Vercel deployment must include a vercel.json with headers configuration to serve COOP/COEP headers for SharedArrayBuffer support.

```
// vercel.json
{
  "headers": [
    { "source": "/(.*)",
      "headers": [
```

```
        { "key": "Cross-Origin-Opener-Policy", "value": "same-origin" },
        { "key": "Cross-Origin-Embedder-Policy", "value": "require-corp" }
      ]
    }
  ]
}
```

13. Performance Benchmarks & Targets

Metric	Target	Method
Real-time latency	<10ms end-to-end	AudioWorklet + SharedArrayBuffer + WebGPU inference
Noise floor	-96dB	32 ERB bands + ML residual removal + spectral gate
THD+N (voice passthrough)	<0.1%	Single-pass spectral architecture, phase-coherent iSTFT
Batch throughput	10 files/min (5-min each)	Worker pool parallelism, WebGPU batch inference
Memory footprint	<512MB peak	Ring buffer pooling, tensor disposal, GC-friendly allocation
First Contentful Paint	<2s	Lazy model loading, deferred spectrogram init
ML model load time	<3s (WebGPU)	INT8 quantized ONNX, cached in browser storage
Voice SDR improvement	+8.5dB	Demucs v4 + BSRNN ensemble on MUSDB18-HQ

— End of Blueprint —
